

SUBCUTANEOUS TESTOSTERONE INJECTIONS

A safe, effective alternative to intramuscular injections.

EASIER TO SELF INJECT

Sub-Q injections are more easily self-administered than IM injections. This means less trips to a clinic, potentially saving time and money for those who have to travel or pay for healthcare visits.

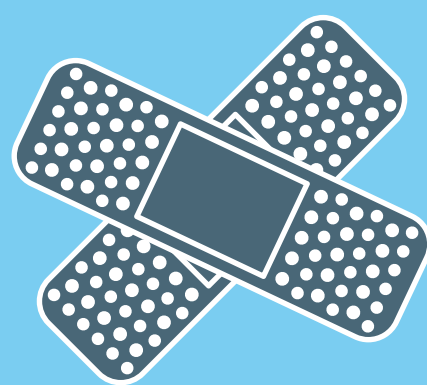

SHORTER NEEDLES

Sub-Q uses shorter needles, as the subcutaneous fat layer is closer to the skin. Many people find this psychologically easier, and some report that it is much less painful.

NO MUSCULAR SCAR TISSUE

Unlike IM injections which build up muscular scar tissue over time, sub-Q injections do not cause internal scarring.

LOWER RISK

Sub-Q injections carry no risk of sciatic nerve injury, as the common injection site is in the belly fat.
